

# Redundancy & backup solutions for Audio over IP distribution network

### Description

2wcoms redundancy and backup solutions for audio over IP distribution networks is comprised of MM01 audio over IP codecs and redundant satellite backup path using a FlexDSR series integrated receiver decoder (IRD). Each MM01 at the studio site transmits its data via the main and backup IP network, so when one fails, both encoders are still transmitted. For additional safety, a satellite distribution chain can be used, that selects and transmits the best encoder output via DVB-S/S2, which then is decoded by an IRD at the transmitter site to step in, in case IP connectivity to that site is lost completely.
