

Audio over Satellite (DVB-S/S2) transmission system with monitoring return channel

Description

2wcoms audio over satellite transmission system is comprised of the MM08E MPEG encoder (encoding up to 8 audio channels) and the FlexDSR series integrated receiver decoder (IRDs), which can decode two (DSR01 and FlexDSR02+) or up to four (FlexDSR04+) audio programs. When there are IP links to the IRDs, they can be used to monitor the IRDs operational state and alarms using the web interface and SMNP, as well as monitoring the audio output via audio streaming.
