

# Audio over IP solution

**Description:** 2wcoms audio over IP solutions cover multiple transmission schemes tailored to cover bandwidth needs, connection reliability and flexibility. 2wcom Stream4Sure mechanism on the MM01 generates multiple audio fallback streams, that can also have different formats and quality levels each, in order to save bandwidth. At the receiver side, Stream4Sure capable devices can switch seamlessly in between fallbacks. A MM08 encoder can feed multiple devices like the FlexDSR04+ or MM01 with single or multiple audio channels per stream, protected by PromPEG FEC for added robustness and reliability. A FM2TS Gateway can be used to encode the audio of up to 8 FM stations and distribute those to remote sites via IP to FlexDSR04+ decoders.
