

MPX over IP transmission system – Overview

Description

2wcoms MPX over IP transmission system solution greatly reduces your system cost and complexity for feeding FM transmitter sites by centrally generating the FM MPX signal in your studio and then transport it using the FMC01 MPX Codec via IP to your transmitter site. There is no more need for stereo and RDS encoders at each site; instead, only one pair is needed once at the studio site. To increase robustness, the IP transmission Pro MPEG FEC can be applied to the IP data stream.
